

1996 VIGORO COATED UREA FERTILITY TRIAL ON TALL FESCUE (VIGORO II)

G. Klein, J. Hartin, S. Blackwood, E. Baltazar, R. Green
University of California, Riverside

Objectives:

To evaluate the performance and nitrogen release of three coated urea fertilizers at two application rates applied to tall fescue, in terms of visual color ratings.

Cultivar:

Marathon III tall fescue.

Experimental Site:

A plot established at the UCR Turfgrass Field Research Center, Riverside, CA on April 3, 1996. The root zone is a native soil which is classified as a Hanford fine sandy loam; pH = 7.1; Olsen-P = 18 ppm; X-K = 75ppm as of July 1995.

Experimental Design:

Randomized Complete Block design with four replications. Plot size 4.5 x 6.0 ft.

Mowing:

Once per week with a rotary mower set at 2.0 inches. Clippings collected.

Irrigation:

Plots irrigated to prevent visual drought symptoms and overwatering.

Fertilizer Treatments:

- Coated urea fertilizers (*one application*):
SCU (39% N), VCUrea45 (45% N), VCUrea60 (44.5% N)
- Two rates of application:
1 lb N/1000 ft² and 1.5 lb N/1000 ft²
- Check (no fertilizer)
- All treatments were applied on September 25, 1996.

Measurements:

Visual turfgrass color ratings taken every two weeks beginning two weeks after initial treatment applications, using a 1 to 9 scale (1=poorest, 5=acceptable, 9=best tall fescue).

1996 Vigoro Coated Urea Fertility Trial (Vigoro II): Visual Color Ratings

Scale: 1-9 (9=greenest tall fescue)

Product	Rate (lb N/M)	10/11/96	10/25/96	11/08/96	11/22/96	12/06/96	12/20/96
